3. FILTER CALCULATION / SIZING

The total pressure drop of a filter at a certain flow rate Q is the sum of the housing $\Delta p$ and element $\Delta p$ and is calculated as follows:

$\Delta p_{\text{total}} = \Delta p_{\text{housing}} + \Delta p_{\text{element}}$

$\Delta p_{\text{housing}} = \text{(see point 3.1)}$

$\Delta p_{\text{Element}} = Q \cdot SK \ast \cdot \text{viscosity}$

$1000 \quad 30$

(see point 3.2)

For ease of calculation, our Filter Sizing Program is available on request free of charge.

3.1 $\Delta P$-Q HOUSING GRAPHS BASED ON ISO 3968

The housing graphs apply to mineral oil with a density of 0.86 kg/dm$^3$ and a kinematic viscosity of 30 mm$^2$/s. In this case, the differential pressure changes proportionally to the density.

3.2 GRADIENT COEFFICIENTS (SK) FOR FILTER ELEMENTS

The gradient coefficients in mbar/(l/min) apply to mineral oils with a kinematic viscosity of 30 mm$^2$/s. The pressure drop changes proportionally to the change in viscosity.
